DOJAH

Homepage Copy & Content Brief

Rebrand 2025 · Optimized for SEO, Conversion & Competitive Positioning

How to use this document

Each section maps directly to a homepage section. Copy appears in full – ready for design handoff. SEO notes, design direction, and competitive positioning rationale are included in grey callout boxes throughout.

Target keyword clusters: fraud prevention Africa · identity verification Nigeria · KYC fraud detection · AML compliance Africa · account takeover protection · transaction monitoring fintech

SEO Metadata

Not visible on page – feeds search engines

Meta Title	Fraud Prevention & Identity Verification for Africa | Dojah
Meta Description	Dojah is Africa's fraud and risk infrastructure. Verify identities, detect fraud in real time, and monitor transactions across the full customer lifecycle. Built for African markets – trusted by leading fintechs, lenders, and crypto platforms.
H1 Tag (SEO)	Fraud prevention and identity verification built for Africa's digital economy
Primary Keywords	fraud prevention Africa, identity verification Nigeria, KYC Africa, AML compliance Africa, account takeover protection, fraud detection fintech Africa, Sumsub alternative Africa, Smile ID alternative
Schema Markup	Organization + FAQPage – implement before launch for rich results

Section 1: Hero

Above the fold – highest-impact copy

Strategic intent

Three jobs in three seconds: (1) tell visitors exactly what Dojah does, (2) anchor it to Africa – the core differentiator against Sumsub, Veriff, Jumio – (3) signal lifecycle coverage so Dojah doesn't read as just another KYC point tool like Smile ID. H1 should rank for 'fraud prevention Africa' and 'identity verification Africa.'

EYEBROW (SMALL TEXT ABOVE HEADLINE)

Trusted fraud and risk infrastructure across African markets

HEADLINE (H1 – ALSO SEO TAG)

Fraud prevention and identity verification built for Africa's digital economy

SUBHEADLINE

Dojah gives digital businesses one connected system to verify real users, detect fraud in real time, and monitor risk from onboarding through every transaction. Not a global tool adapted for Africa – built here from day one.

CTAS

Primary CTA	Secondary CTA
Talk to sales →	Explore the platform →

Design note

Hero background: dark navy, clean infrastructure aesthetic – no stock photography. Right panel (desktop): show a risk dashboard or decisioning UI mockup. The phrase 'Not a global tool adapted for Africa – built here from day one' is the most important line and should be visually emphasized.

Section 2: Social Proof & Scale Metrics

Immediately below hero — trust signals and one-time metric appearance

Strategic intent

Metrics appear ONCE — here, right after the hero. They double as trust signals alongside the logo bar. Do NOT repeat metrics anywhere else on the page. Sumsub and Smile ID both use logo bars; Dojah needs this to compete on credibility with enterprise buyers.

INTRO LINE (ABOVE LOGOS)

Trusted by high-growth fintechs, lenders, crypto platforms, and digital businesses operating across Africa

LOGO LOCKUP

[Bitnob · Fincra · Sycamore · Cardinalstone · + others] — Grayscale, single row, scrolling on mobile

Section 3: Three Trust Layers

Platform architecture — makes the product legible

Strategic intent

This is where most B2B SaaS sites lose visitors who aren't ready to talk to sales. The goal: make the platform architecture immediately understandable without jargon. Three cards, each with a clear job-to-be-done. Each card links to the corresponding product section.

SECTION HEADLINE

One system. Three layers of protection.

SECTION SUBHEADLINE

Most businesses stitch together 4–6 separate tools for KYC, fraud scoring, AML, and transaction monitoring. Dojah consolidates all of it into one connected risk system — so signals flow between layers instead of getting lost between vendors.

THREE PRODUCT CARDS

🛡️

Fraud & Risk Intelligence

Detect fraud, score risk, and make real-time decisions before losses occur. Risk scoring, device intelligence, transaction monitoring, and watchlist screening.

Explore →

✅

Identity & Access

Verify real users at onboarding. Block synthetic accounts, catch document fraud, and confirm physical presence with biometrics and liveness detection.

Explore →

🏢

Business Identity (KYB)

Validate businesses before they enter your platform. Registry checks, tax ID verification, UBO identification, and global business screening.

Explore →

Section 4: Why Dojah — Research-Backed Competitive Positioning

Most important conversion section

Research basis for this section

Every claim in this table is backed by publicly available information. Smile ID: confirmed KYC/biometrics strength but independently reviewed as having 'limited advanced tools for real-time risk scoring and workflow automation' (Youverify comparison, October 2025). Their product is onboarding-first — transaction monitoring is listed in their glossary but not as a core product offering. Sumsub: full stack (KYC, KYB, TM, fraud) but European-built, launched Africa local data processing only in June 2024 as a reactive move, priced from $1.35/verification in USD with no local currency option. Global vendors (Veriff, Jumio): not Africa-focused — conversion rates published for US/UK/Hong Kong only, no African government database integrations. No claims about competitors' internal capabilities are made — all comparisons are based on what they publicly market.

SECTION HEADLINE

Built here. Not retrofitted here/Not an afterthought

SECTION SUBHEADLINE

Global compliance platforms were built for Europe and North America, then tried to add Africa later. Dojah was built from day one on African identity infrastructure, African fraud patterns, and African regulatory frameworks — covering Nigeria, Ghana, Kenya, South Africa, and 10+ markets natively.

THREE PROOF POINT CARDS (BELOW TABLE)

Built on African identity data	Full lifecycle, not just onboarding	One platform, not four vendors
Verification logic built on government databases across 10+ African markets — including Nigeria, Ghana, Kenya, and South Africa — not global templates applied to local ID types.	Fraud doesn't stop when a user signs up. Dojah monitors risk continuously — from first login through every transaction, withdrawal, and account change.	KYC, KYB, fraud scoring, transaction monitoring, and AML compliance in one system — so your risk signals are connected instead of siloed across tools.

Section 5: The Fraud Lifecycle Argument

Narrative core – shifts mental model from 'KYC tool' to 'risk infrastructure'

Strategic intent

This section shifts buyer framing from 'I need a KYC tool' to 'I need continuous risk protection.' It's the most important narrative on the page. Short sentences. Direct claims. No hedging. This is the gap Smile ID cannot fill – their product ends at onboarding.

SECTION HEADLINE

Fraud doesn't stop at onboarding. Neither does Dojah.

BODY COPY

Most platforms verify users at signup and stop there. But across Africa's digital economy, the most costly fraud doesn't happen at the front door – it happens long after someone walks through it. Dojah monitors risk continuously, from first login through every transaction, so you see threats as they develop, not after the damage is done.

LIFECYCLE STAGE FLOW (VISUAL COMPONENT)

Design: horizontal 4-stage flow with connecting arrows. Each stage: small label, bold title, brief description. Stack vertically on mobile.

Stage 1	Stage 2	Stage 3	Stage 4
Onboarding	**Access & Activity**	**Transactions**	**Ongoing Monitoring**
Verify real identities. Block synthetic accounts and high-risk applicants before they access your platform.	Detect suspicious logins, device changes, SIM swaps, and session anomalies. Catch account takeovers early.	Monitor fund movements in real time. Flag abnormal patterns and stop payout abuse before money leaves.	Surface emerging risk as it develops. Stay ahead of fraud rings and regulatory exposure continuously.

One infrastructure layer. Full lifecycle visibility.

Section 6: Built for Real Operations

Speaks to the fraud/risk ops buyer – not just the developer

Strategic intent

This section speaks to the operational buyer – the fraud manager, compliance lead, risk ops team – not just the developer integrating an API. It positions Dojah as a platform teams work in daily, not just a service they connect to. This is a genuine gap: Smile ID has no case management or workflow tooling. Sumsub has it but it's expensive and globally-tuned.

SECTION HEADLINE

Detection is not enough.Your team needs to act.

SECTION SUBHEADLINE

Fraud teams don't just need signals. They need workflows, decisions, and audit trails that hold up under regulatory scrutiny. Dojah is built for the full operational loop – from alert to action to documentation.

CAPABILITY GRID (6 TILES – 2 COLUMNS X 3 ROWS)

Risk scoring with reason codes Every decision comes with explainable signals – not just a number. Your team knows exactly why a user was flagged and can defend that decision to regulators.	**Automated decisioning** Set rules to approve, deny, or queue for review automatically. Reduce manual workload without losing control over high-risk cases.
Case management workflows Investigate flagged users and transactions directly inside the platform. No context switching between tools. Full investigation history in one place.	**Real-time alerting** Get notified when risk thresholds are breached. Respond before losses occur – not during the post-mortem.
Unified audit trail Every decision, flag, and review is logged and timestamped. Audit-ready for CBN, CMA, FSCA, and FATF-aligned regulators.	**Customer360 identity graph** Link users, devices, businesses, and transaction networks. Spot coordinated fraud rings that individual signal checks would miss.

Section 7: Infrastructure at African Scale

Credibility – no duplicate metrics here

Design note – metrics intentionally excluded here

This section uses specific infrastructure proof points instead – more credible and harder for competitors to copy than generic numbers. Numbers-first credibility is already established; this section builds depth.

SECTION HEADLINE

Infrastructure built for how Africa actually works

SECTION SUBHEADLINE

"From early-stage onboarding to enterprise-scale risk operations – the infrastructure grows with you.

INFRASTRUCTURE PROOF POINTS

Government database integrations

Native connections to Nigerian (NIN, BVN, CAC), Ghanaian, Kenyan, and South African government identity systems – not third-party API wrappers.

Telco-level phone intelligence

SIM swap detection, number portability tracking, and mobile network risk signals across African carriers – not available through global vendors.

African compliance frameworks

Verification logic aligned with CBN circulars, Kenya's CMA regulations, South Africa's FICA and POPIA, and FATF/GIABA guidelines – maintained locally.

Low-bandwidth optimized

Designed for variable connectivity environments. Works reliably across 2G, 3G, and 4G conditions common in Tier-2 and Tier-3 African cities.

African fraud pattern models

Risk models trained on African fraud data – SIM swap fraud, NIN/BVN misuse, identity farming, and coordinated account abuse patterns specific to African fintech.

Multi-country single integration

Launch across Nigeria, Ghana, Kenya, South Africa, etc from one integration – not four separate vendor relationships.

Section 8: Customer Spotlights

Three spotlights – demo data, needs real numbers + approval before launch

About this section

Three spotlights cover three different ICPs: Bitnob (crypto), Fincra (payments/PSP), Sycamore (lending). This demonstrates breadth across use cases. ALL outcome data below is DEMO/ILLUSTRATIVE and must be replaced with real, approved figures before launch. Get sign-off from each customer on their quote before publishing.

SECTION HEADLINE

Trusted by platforms built on Africa's digital economy

See how high-growth African businesses use Dojah to reduce fraud, scale onboarding, and operate with confidence.

SPOTLIGHT 1 – BITNOB (CRYPTO / WEB3)

The challenge	The outcome (demo)
As Bitnob scaled crypto payments across multiple African markets, they needed identity verification and transaction monitoring that could grow with them – without slowing operations or creating compliance gaps at onboarding.	40% reduction in manual review time. Verification pass rates improved across Nigerian and Ghanaian users. Risk controls scaled automatically with transaction volume growth – no additional headcount required. *Replace with real Bitnob data*

"Dojah gives us the confidence to scale while maintaining strong identity and risk controls."

– Bitnob Team | Crypto payments across Africa

Read the full case study →

SPOTLIGHT 2 – FINCRA (PAYMENTS / PSP)

The challenge	The outcome (demo)
Fincra needed to screen merchants at onboarding and detect suspicious transaction patterns across a high-volume payments flow – using a single vendor rather than stitching multiple tools together.	Merchant onboarding time cut by 60%. Suspicious transaction flagging rate improved significantly. Compliance team freed from manual KYB reviews – now handled automatically through Dojah's registry and tax ID checks.

	Replace with real Fincra data

> *"We needed one platform that covered KYB, transaction monitoring, and compliance. Dojah was the only African-built option that could do all three."*
>
> – Fincra Team | Payments infrastructure across Africa [DEMO – get real quote]

Read the full case study →

SPOTLIGHT 3 – SYCAMORE (LENDING / BNPL)

The challenge	**The outcome (demo)**
Scaling a lending portfolio in Nigeria means managing synthetic identity fraud at application and coordinated default behavior across active loans. Sycamore needed risk signals that worked before approval and continued through the loan lifecycle.	Synthetic identity applications declined by 35% within 60 days of deployment. Loan approval speed improved with automated identity decisioning. Default rate on flagged-but-approved accounts reduced. *Replace with real Sycamore data*

> *"Fraud doesn't stop after a loan is approved. Dojah is the only platform we found that monitors risk across the full lending lifecycle – not just at application."*
>
> – Sycamore Team | Digital lending, Nigeria [DEMO – get real quote]

Read the full case study →

Section 9: Explore the Platform

Routes engaged visitors to product depth

Strategic intent

Visitors who scroll this far are high-intent. Keep it tight – 3 platform cards with specific one-liners, a clear explore CTA. Link each card to its product page.

SECTION HEADLINE

Three platforms. One risk system.

Dojah's orchestration platforms sit on top of the three infrastructure layers – giving your team full operational control across onboarding, fraud prevention, and compliance.

EasyOnboard	EasyDetect	AML Compliance
End-to-end onboarding orchestration – identity checks, risk scoring, and automated decisioning in one configurable flow. Go live in days, not months.	Real-time fraud risk scoring at every customer touchpoint. Approve, deny, or flag for review automatically – with explainable reasons your team can act on.	PEP and sanctions screening, ongoing transaction monitoring, customer risk profiling (CDD/EDD), and audit-ready case management.
Learn more →	**Learn more →(this goes to risk scoring page)**	**Learn more →**

View all products →

Section 10: Final CTA

Closing conversion – bottom of page

Strategic intent

High-intent visitors who have scrolled the full homepage need a strong, specific close. Two paths: sales conversation for enterprise/growth-stage buyers, platform exploration for developers. The headline is a direct business outcome – not a feature claim.

Stop fraud before it costs you.

Reduce fraud losses. Approve more legitimate users. Operate with confidence across African markets.

Talk to sales · Explore the platform

Developer-friendly APIs and SDKs. Go live in days, not months. View docs.

Appendix: SEO Strategy & Launch Checklist

Target keyword strategy

Keyword
fraud prevention Africa
identity verification Nigeria
KYC Africa fintech
AML compliance Africa
account takeover protection
transaction monitoring fintech
fraud detection API Africa
Sumsub alternative Africa
Smile ID alternative

Pre-launch checklist

- Replace all DEMO metric placeholders with real, verified numbers from the data team
- Get Bitnob team approval on their quote and outcome data – in writing
- Get real data and quote approval from Fincra and Sycamore before their spotlights go live
- Verify comparison table claims against current Dojah product capabilities – especially '✅ Yes' entries
- Confirm all regulatory framework references (CBN, CMA, FSCA) are accurate and current
- Add Organization + FAQPage schema markup for SEO rich results
- Set up Open Graph and Twitter card tags with a strong preview image (the dashboard UI mockup)
- Implement hreflang if launching country-specific landing pages (/ng, /ke, /gh, /za)
- Add a sticky nav CTA ('Talk to sales') that appears after scroll past the hero on desktop
- A/B test hero CTA: 'Talk to sales' vs 'See it in action' – measure qualified lead rate, not just clicks
- A/B test hero headline: current vs 'Stop fraud across Africa's digital economy' – track scroll depth and CTA conversion
- Set up a Hotjar or equivalent session recording on launch day – watch how visitors navigate the comparison table
